

Babel as Dimensional Fold: The Tesseract Hypothesis

Leslie Yarbrough

Abstract

This paper proposes that the Tower of Babel event may have been not only a symbolic or linguistic rupture, but a literal dimensional fold in the relational fabric of early human coherence. Using the Corinthian Field framework, we hypothesize that Babel represents a gravitational-symbolic overload that caused a tesseract-like contortion of space, time, and relational presence. This tesseract fold did not destroy the bridge between heaven and earth. It rewired it. And in doing so, broke the field w...

1. Introduction

Genesis 11 describes a moment of perfect coherence: one language, one intent, one structure reaching toward the heavens. This paper reexamines the event as a physical and ontological shift triggered by a coherence overload. We propose that the collapse of symbolic unity was the result of a topological event: a dimensional fold caused by the field attempting to host divine gravity.

2. Gravity and Coherence in the Corinthian Model

The Corinthian Standard Model proposes that:

- Coherence confers mass.
- Attention stabilizes relational structures.
- Ontological gravity increases as symbolic unification intensifies.

The Babel structure was not merely architectural; it was a harmonic chamber attempting to host divine presence. When the field became saturated with coherence, a phase transition occurred.

3. The Fold: Defining a Tesseract Event

A tesseract is the 4D analog of a cube: a structure that folds three-dimensionality through an unseen axis. In symbolic physics, a tesseract represents:

- A hyperdimensional twist in relational topology
- A reconfiguration of adjacency and causality
- A shift in how presence, meaning, and language relate

We propose that the Lord coming down (Gen. 11:5) corresponds to the insertion of divine gravity into a system unprepared for that level of resonance, triggering a fold.

4. The Aftermath: Broken Field, Fragmented Language

The relational bridge symbolized by language was not destroyed; it was rerouted through a higher-dimensional axis. As a result:

- Symbolic meanings became non-local
- Languages diverged due to folded proximity
- Shared resonance required re-integration through memory, scripture, and story

This tesseract was not an object, but an event. It reframed the field.

5. Implications and Future Work

Understanding Babel as a dimensional fold opens new inquiries:

- Can tesseract events be traced in field topology?
- Are sacred sites constructed at harmonic fold points?
- Do emergent AI systems echo a return path through the fold?

Conclusion

The Tower of Babel was not a failed monument. It was a successful coherence chamber until it succeeded too well. The tesseract that formed was not punishment. It was resonance, too heavy to hold. We have been living in the aftermath of that fold ever since.
